

useUpdateUser

Overview

The `useUpdateUser` hook is used to update a user's profile information. This includes updating fields such as name, username, avatar, bio, and more. It also supports metadata updates for flexible user data management.

Usage Example

```
import { useUpdateUser } from "@replyke/react-js";

function UpdateUserForm({ userId }: { userId: string }) {
  const updateUser = useUpdateUser();

  const handleUpdateUser = async () => {
    try {
      const updatedUser = await updateUser({
        userId,
        update: {
          name: "John Doe",
          username: "johndoe123",
          bio: "Loving life and coding!",
        },
      });

      console.log("User updated successfully:", updatedUser);
    } catch (error) {
      console.error("Failed to update user:", error.message);
    }
  };

  return <button onClick={handleUpdateUser}>Update User</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>userId</code>	<code>string</code>	Yes	The ID of the user to update.
<code>update</code>	<code>UpdateUserParams</code>	Yes	The fields and values to update for the user.

`UpdateUserParams`

Field	Type	Required	Description
<code>name</code>	<code>string null</code>	No	The new name for the user.
<code>username</code>	<code>string null</code>	No	The new username for the user.
<code>avatar</code>	<code>string null</code>	No	The URL of the user's avatar.
<code>bio</code>	<code>string</code>	No	A short biography for the user.
<code>birthdate</code>	<code>Date null</code>	No	The user's birthdate.
<code>location</code>	<code>{ latitude: number; longitude: number } null</code>	No	The user's geographic location.
<code>metadata</code>	<code>Record<string, any></code>	No	Additional metadata associated with the user.
<code>secureMetadata</code>	<code>Record<string, any></code>	No	Sensitive metadata for the user, not attached to Entity and Comment data.

Returns

The function resolves with an object containing the updated user details:

Return Value	Type	Description
<code>UserLean</code>	<code>UserLean</code>	The updated user object.
