

useFetchUser

Overview

The `useFetchUser` hook is used to retrieve detailed information about a specific user within the current project by their user ID. This can be useful for displaying user profiles or fetching data for interactions.

Usage Example

```
import { useFetchUser } from "@replyke/react-js";

function UserProfile({ userId }: { userId: string }) {
  const fetchUser = useFetchUser();

  const handleFetchUser = async () => {
    try {
      const user = await fetchUser({ userId });
      console.log("Fetched user details:", user);
    } catch (error) {
      console.error("Failed to fetch user details:", error.message);
    }
  };

  return <button onClick={handleFetchUser}>Fetch User</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following field:

Parameter	Type	Required	Description
<code>userId</code>	<code>string</code>	Yes	The ID of the user to fetch.

Returns

The function resolves with a user object containing lean user details:

Return Value	Type	Description
UserLean	UserLean	The details of the fetched user object.
