

# useCreateList

## Overview

---

The `useCreateList` hook is used to create a new list within the current project. The newly created list is associated with a parent list, enabling the creation of hierarchical list structures.

## Usage Example

---

```
import { useCreateList } from "@replyke/react-js";

function CreateListButton({ parentListId }: { parentListId: string }) {
  const createList = useCreateList();

  const handleCreateList = async () => {
    try {
      const newList = await createList({
        listName: "My New List",
        parentListId,
      });

      console.log("List created successfully:", newList);
    } catch (error) {
      console.error("Failed to create list:", error.message);
    }
  };

  return <button onClick={handleCreateList}>Create List</button>;
}
```

## Parameters & Returns

---

### Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>listName</code>	<code>string</code>	Yes	The name of the new list to be created.
<code>parentListId</code>	<code>string</code>	Yes	The ID of the parent list under which the new list is created. Each user has a root list to serve as parent if creating a first level list.

## Returns

The function resolves with an object representing the newly created list:

Return Value	Type	Description
<code>List</code>	<code>List</code>	The new created list object.
