

useUpdateList

Overview

The `useUpdateList` hook is used to update the details of a specific list within the current project. This includes updating properties like the list's name.

Usage Example

```
import { useUpdateList } from "@replyke/react-js";

function UpdateListButton({ listId }: { listId: string }) {
  const updateList = useUpdateList();

  const handleUpdateList = async () => {
    try {
      const updatedList = await updateList({
        listId,
        update: {
          name: "Updated List Name",
        },
      });

      console.log("List updated successfully:", updatedList);
    } catch (error) {
      console.error("Failed to update list:", error.message);
    }
  };

  return <button onClick={handleUpdateList}>Update List</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>listId</code>	<code>string</code>	Yes	The ID of the list to be updated.
<code>update</code>	<code>Partial<{ name: string }></code>	Yes	The properties to update for the list.

Returns

The function resolves with an object representing the updated list:

Return Value	Type	Description
<code>List</code>	<code>List</code>	The details of the updated list.
