

useIncrementEntityViews

Overview

The `useIncrementEntityViews` hook is used to increment the view count of a specific entity. It ensures that the view count is incremented only once per entity per session by tracking the status internally.

Usage Example

```
import { useIncrementEntityViews } from "@replyke/react-js";

function EntityViewTracker({ entityId }: { entityId: string }) {
  const incrementEntityViews = useIncrementEntityViews();

  const handleViewIncrement = async () => {
    try {
      await incrementEntityViews({ entityId });
      console.log("Entity views incremented successfully.");
    } catch (error) {
      console.error("Failed to increment entity views:", error.message);
    }
  };

  return <button onClick={handleViewIncrement}>Track Entity View</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>entityId</code>	<code>string</code>	Yes	The unique ID of the entity to increment the views for.

Returns

The function does not return a value but ensures the view count is incremented on the server upon successful execution.
