

useFetchUserFollowersCount

Overview

The `useFetchUserFollowersCount` hook is used to retrieve the number of followers for a specific user within the current project. This is useful for displaying follower counts in user profiles or social features.

Usage Example

```
import { useFetchUserFollowersCount } from "@replyke/react-js";

function FollowerCountDisplay({ userId }: { userId: string }) {
  const fetchUserFollowersCount = useFetchUserFollowersCount();

  const handleFetchFollowersCount = async () => {
    try {
      const { count } = await fetchUserFollowersCount({ userId });
      console.log(`User has ${count} followers.`);
    } catch (error) {
      console.error("Failed to fetch followers count:", error.message);
    }
  };

  return (
    <button onClick={handleFetchFollowersCount}>Get Followers Count</button>
  );
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts the following parameter:

Parameter	Type	Required	Description
<code>userId</code>	<code>string</code>	Yes	The ID of the user to fetch follower count for.

Returns

The function resolves with an object containing the follower count:

Return Value	Type	Description
<code>response.count</code>	<code>number</code>	The number of followers.
