

useFetchFollow

Overview

The `useFetchFollow` hook is used to determine whether a user is following another user within the current project. It verifies the relationship based on the logged-in user's ID and the target user's ID.

Usage Example

```
import { useFetchFollow } from "@replyke/react-js";

function FollowStatus({ targetUserId }: { targetUserId: string }) {
  const fetchFollow = useFetchFollow();

  const handleCheckFollow = async () => {
    try {
      const isFollowing = await fetchFollow({ userId: targetUserId });
      console.log(
        isFollowing
        ? "You are following this user."
        : "You are not following this user."
      );
    } catch (error) {
      console.error("Failed to fetch follow status:", error.message);
    }
  };

  return <button onClick={handleCheckFollow}>Check Follow Status</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following field:

Parameter	Type	Required	Description
<code>userId</code>	<code>string</code>	Yes	The ID of the user to check follow status for.

Returns

The function resolves with a boolean value:

Return Value	Type	Description
<code>isFollowing</code>	<code>boolean</code>	<code>true</code> if the logged-in user is following the target user, otherwise <code>false</code> .
