

# useCountUnreadNotifications

## Overview

The `useCountUnreadNotifications` hook is used to retrieve the total count of unread notifications for the currently authenticated user. This is useful for displaying notification badges or summaries.

## Usage Example

```
import { useCountUnreadNotifications } from "@replyke/react-js";

function UnreadNotificationsBadge() {
  const countUnreadNotifications = useCountUnreadNotifications();

  const handleFetchUnreadCount = async () => {
    try {
      const unreadCount = await countUnreadNotifications();
      console.log("Unread notifications count:", unreadCount);
    } catch (error) {
      console.error(
        "Failed to fetch unread notifications count:",
        error.message
      );
    }
  };

  return <button onClick={handleFetchUnreadCount}>Get Unread Count</button>;
}
```

## Parameters & Returns

### Parameters

The hook does not require any parameters.

### Returns

The function resolves with the count of unread notifications:

Return Value	Type	Description
Count	number	The total count of unread notifications.
