

useRemoveFromList

Overview

The `useRemoveFromList` hook is used to remove an entity from a specified list within the current project. This allows users to dynamically manage the contents of their lists by removing entities as needed.

Usage Example

```
import { useRemoveFromList } from "@replyke/react-js";

function RemoveFromListButton({
  entityId,
  listId,
}: {
  entityId: string;
  listId: string;
}) {
  const removeFromList = useRemoveFromList();

  const handleRemoveFromList = async () => {
    try {
      const updatedList = await removeFromList({
        entityId,
        listId,
      });

      console.log("Entity removed from list successfully:", updatedList);
    } catch (error) {
      console.error("Failed to remove entity from list:", error.message);
    }
  };

  return <button onClick={handleRemoveFromList}>Remove from List</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>entityId</code>	<code>string</code>	Yes	The ID of the entity to be removed from the list.
<code>listId</code>	<code>string</code>	Yes	The ID of the list from which the entity will be removed.

Returns

The function resolves with an object representing the updated list:

Return Value	Type	Description
<code>List</code>	<code>List</code>	The updated list object after the removed entity.
