

# useFetchAppNotifications

## Overview

The `useFetchAppNotifications` hook is used to retrieve a paginated list of app notifications for the currently authenticated user. Notifications include updates or actions relevant to the user within the project.

## Usage Example

```
import { useFetchAppNotifications } from "@replyke/react-js";

function NotificationsList() {
  const fetchAppNotifications = useFetchAppNotifications();

  const handleFetchNotifications = async () => {
    try {
      const notifications = await fetchAppNotifications({ page: 1, limit: 10 });
      console.log("Fetched notifications:", notifications);
    } catch (error) {
      console.error("Failed to fetch notifications:", error.message);
    }
  };

  return <button onClick={handleFetchNotifications}>Fetch Notifications</button>;
}
```

## Parameters & Returns

### Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
<code>page</code>	<code>number</code>	Yes	The page number to fetch.

Parameter	Type	Required	Description
limit	number	Yes	The number of notifications per page.

## Returns

The function resolves with an array of app notifications:

Return Value	Type	Description
UnifiedAppNotification[]	UnifiedAppNotification[]	A list of app notifications for the user.
