

useDeleteComment

Overview

The `useDeleteComment` hook allows users to delete a specific comment by its ID. This is useful for implementing comment moderation or user-controlled deletion features in your application.

Usage Example

```
import { useDeleteComment } from "@replyke/react-js";

function DeleteCommentButton({ commentId }: { commentId: string }) {
  const deleteComment = useDeleteComment();

  const handleDeleteComment = async () => {
    try {
      await deleteComment({ commentId });
      console.log("Comment deleted successfully.");
    } catch (error) {
      console.error("Failed to delete comment:", error.message);
    }
  };

  return <button onClick={handleDeleteComment}>Delete Comment</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following field:

Parameter	Type	Required	Description
<code>commentId</code>	<code>string</code>	Yes	The ID of the comment to be deleted.

Returns

The function does not return a value but ensures the specified comment is deleted upon successful execution.
