useRemoveEntityUpvote

Overview

The `useRemoveEntityUpvote` hook provides a way to remove a previously cast upvote from an entity.

Usage Example

```
import { useRemoveEntityUpvote } from "@replyke/react-js";
import { Button } from "@/components/ui/button";

function EntityComponent({ entityId }: { entityId: string }) {
  const removeUpvote = useRemoveEntityUpvote();

  const handleRemoveUpvote = async () => {
    try {
      const response = await removeUpvote({ entityId });
      console.log("Upvote removed:", response);
    } catch (err) {
      console.error("Failed to remove upvote:", err);
    }
  };

  return <Button onClick={handleRemoveUpvote}>Remove Upvote</Button>;
}
```

Parameters & Returns

Parameters

The `removeEntityUpvote` function returned by the hook accepts a single object with the following field:

Parameter	Type	Description
`entityId`	`string`	The ID of the entity whose upvote to remove.

Returns

The function returns a `Promise<Entity>` representing the API response:

Return Value	Type	Description
`Updated comment`	`Entity`	The updated entity after the upvote is successfully removed.
