useUnfollowUser

Overview

The `useUnfollowUser` hook allows a logged-in user to unfollow another user within the current project. This hook ensures that users can only unfollow valid targets and handles necessary validations.

Usage Example

```
import { useUnfollowUser } from "@replyke/react-js";

function UnfollowUserButton({ targetUserId }: { targetUserId: string }) {
  const unfollowUser = useUnfollowUser();

  const handleUnfollowUser = async () => {
    try {
      await unfollowUser({ userId: targetUserId });
      console.log("Successfully unfollowed the user.");
    } catch (error) {
      console.error("Failed to unfollow user:", error.message);
    }
  };

  return <button onClick={handleUnfollowUser}>Unfollow User</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following field:

Parameter	Type	Required	Description
`userId`	`string`	Yes	The ID of the user to unfollow.

Returns

The function does not return a value but ensures the unfollow action is executed successfully on the server.
