useUpdateComment

Overview

The `useUpdateComment` hook allows you to update the content of a specific comment. This is useful for enabling comment editing functionality in your application.

Usage Example

```jsx
import { useUpdateComment } from "@replyke/react-js";

function EditComment({ commentId }: { commentId: string }) {
  const updateComment = useUpdateComment();

  const handleUpdateComment = async () => {
    try {
      const updatedComment = await updateComment({
        commentId,
        content: "This is the updated comment content!",
      });

      console.log("Comment updated successfully:", updatedComment);
    } catch (error) {
      console.error("Failed to update comment:", error.message);
    }
  };

  return <button onClick={handleUpdateComment}>Update Comment</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
`commentId`	`string`	Yes	The ID of the comment to update.
`content`	`string`	Yes	The updated content for the comment.

Returns

The function resolves with the updated comment object:

Return Value	Type	Description
`Updated comment`	`Comment`	The details of the updated comment.
