useFetchEntityByShortId

Overview

The `useFetchEntityByShortId` hook is used to retrieve details of a specific entity by providing its `shortId`.

Usage Example

```
import { useFetchEntityByShortId } from "@replyke/react-js";

function EntityDetails({ entityId }: { entityId: string }) {
  const fetchEntityByShortId = useFetchEntityByShortId();

  const handleFetchEntity = async () => {
    try {
      const entity = await fetchEntityByShortId({
        entityId,
      });

      console.log("Fetched entity:", entity);
    } catch (error) {
      console.error("Failed to fetch entity:", error.message);
    }
  };

  return <button onClick={handleFetchEntity}>Fetch Entity Details</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
`shortId`	`string`	Yes	The short identifier for the entity.

Returns

The function resolves with an object representing the fetched entity:

Return Value	Type	Description
`Entity`	`object`	The details of the retrieved entity.
