Get Comment by Foreign ID

Endpoint

URL: `/:projectId/comments/by-foreign-id`

Method: `GET`

Authentication Required: No

Description

Fetches a single comment using its `foreignId`. Optionally returns the parent comment if it exists and `withParent=true` is passed.

This is useful when using a custom identifier set by the client, instead of the internal comment ID.

Request

Query Parameters

Parameter	Type	Required	Description
`foreignId`	`string`	Yes	The external reference ID used to identify a comment.
`withParent`	`string`	No	If `true`, includes the parent comment.

Response

Success Response (`200 OK`)

Returns the requested comment and optionally its parent:

```json
{
  "comment": {
    "id": "comment-123",
    "foreignId": "abc-456",
    "content": "Loved this!",
    ...
  },
  "parentComment": {
    "id": "comment-001",
    "content": "Parent reply",
    ...
  }
}
```

If there is no parent or `withParent` is not provided:

```json
{
  "comment": { ... },
  "parentComment": null
}
```

Error Responses

Missing or Invalid Foreign ID (`400 Bad Request`)

```json
{
  "error": "Missing valid reference ID in request query",
  "code": "comment/invalid-request"
}
```

Not Found (`404 Not Found`)

```json
{
  "error": "Comment not found",
  "code": "comment/not-found"
}
```

Server Error (`500 Internal Server Error`)

```
{
  "error": "Internal server error.",
  "code": "comment/server-error",
  "details": "[error message]"
}
```

Notes

- Requires a valid `foreignId` to locate the comment.
- Set `withParent=true` to include the parent comment.
- Returns `parentComment: null` if there is no parent or it's not requested.
