useRemoveEntityDownvote

Overview

The `useRemoveEntityDownvote` hook provides a way to remove a previously cast downvote from an entity.

Usage Example

```
import { useRemoveEntityDownvote } from "@replyke/react-js";
import { Button } from "@/components/ui/button";

function EntityComponent({ entityId }: { entityId: string }) {
  const removeDownvote = useRemoveEntityDownvote();

  const handleRemoveDownvote = async () => {
    try {
      const response = await removeDownvote({ entityId });
      console.log("Downvote removed:", response);
    } catch (err) {
      console.error("Failed to remove downvote:", err);
    }
  };

  return <Button onClick={handleRemoveDownvote}>Remove Downvote</Button>;
}
```

Parameters & Returns

Parameters

The `removeEntityDownvote` function returned by the hook accepts a single object with the following field:

Parameter	Type	Description
`entityId`	`string`	The ID of the entity whose downvote to remove.

Returns

The function returns a `Promise<Entity>` representing the API response:

Return Value	Type	Description
`Updated comment`	`Entity`	The updated entity after the downvote is successfully removed.
