useFetchEntity

Overview

The `useFetchEntity` hook is used to retrieve details of a specific entity by providing its UUID.

Usage Example

```tsx
import { useFetchEntity } from "@replyke/react-js";

function EntityDetails({ entityId }: { entityId: string }) {
  const fetchEntity = useFetchEntity();

  const handleFetchEntity = async () => {
    try {
      const entity = await fetchEntity({
        entityId,
      });

      console.log("Fetched entity:", entity);
    } catch (error) {
      console.error("Failed to fetch entity:", error.message);
    }
  };

  return <button onClick={handleFetchEntity}>Fetch Entity Details</button>;
}
```

Parameters & Returns

Parameters

The hook returns a function that accepts an object with the following fields:

Parameter	Type	Required	Description
entityId	string	Yes	The unique UUID of the entity to fetch.

Returns

The function resolves with an object representing the fetched entity:

Return Value	Type	Description
`Entity`	`object`	The details of the retrieved entity.
